

# Chimney Restoration

## With Relining Systems

### The Perfect Solution for:

#### Unlined Chimneys

Unlined Chimneys are unsafe for use with any fuel.

#### Fire Damaged Chimneys

Chimney fires can damage tile liners.

Chimneys should be relined when tile mortar joints are defective, or when tiles are cracked or broken.

#### Oversized Flues

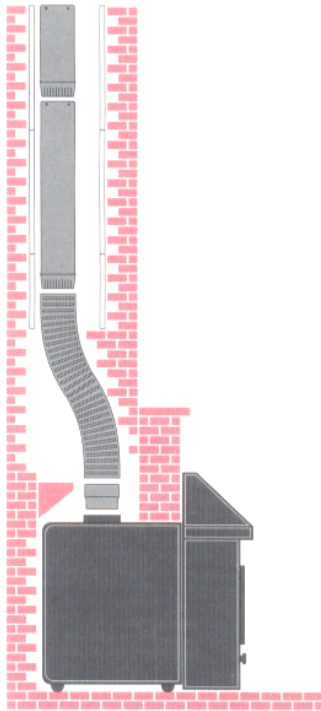

Most high efficiency heaters use small diameter flues, requirements that are generally not met when vented through conventional masonry chimneys. Relining down to the appropriate size is the proper solution.

#### Fireplace Relines

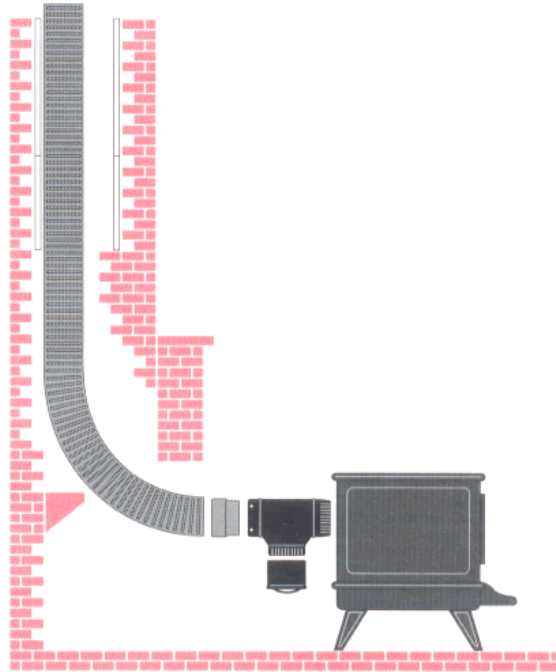

Large diameter fireplace flues can be relined using liners sized to standard masonry fireplace sizing charts.

#### Venting Appliances Through Fireplaces

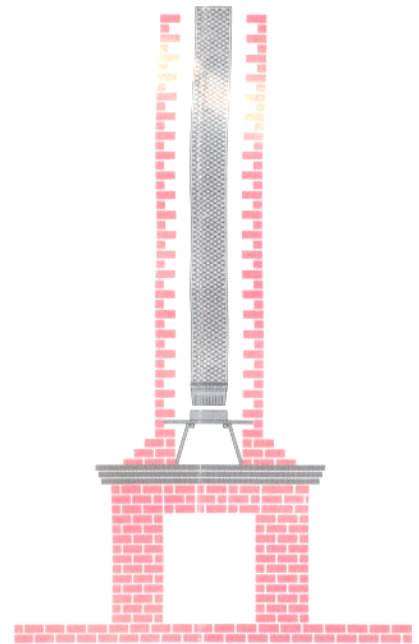

Inserts and hearth stoves should be lined from the stove outlet to the chimney top. Added cost will be recouped from greater heater efficiency and annual cleaning savings.

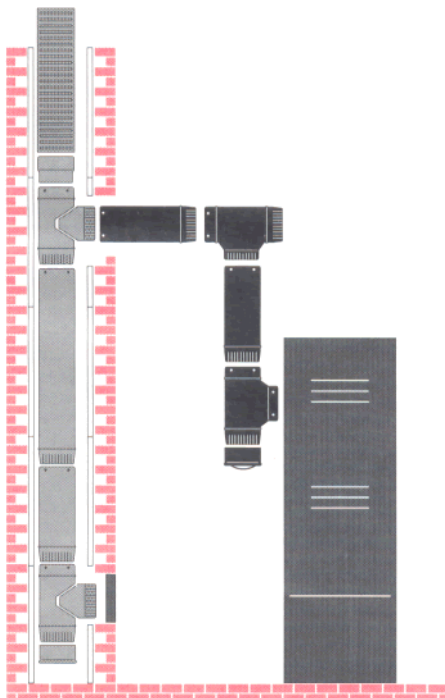

**FIREPLACE INSERT INSTALLATION**

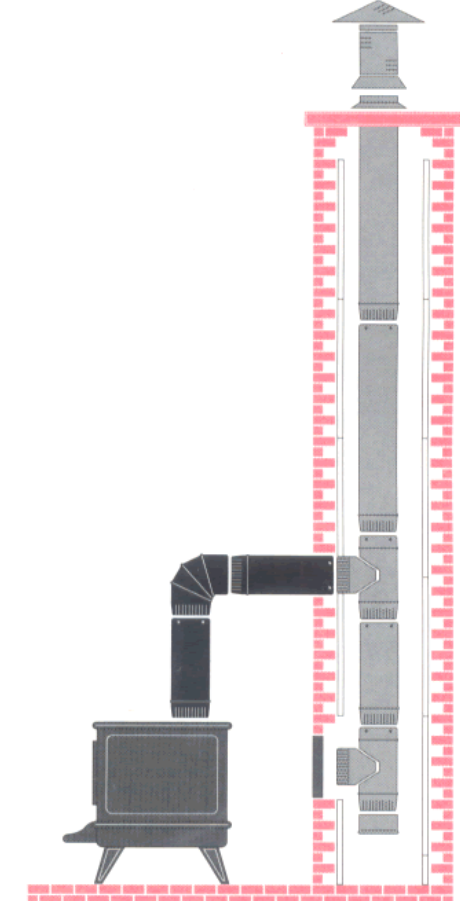

**HEARTH STOVE INSTALLATION**

**FIREPLACE RELINE**
